- Static leaching test (anoxic) : PC, BC, YCW

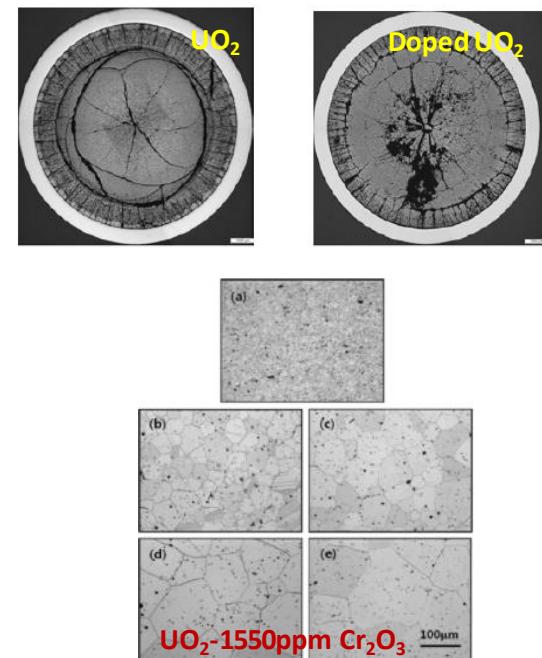

## 5. Conclusions

# 1. Introduction

## Advanced Doped Pellet Technology: Optimization in-pile behaviour

- **ADOPT (Advanced DOped Pellet Technology):  $\text{UO}_2 - \text{Cr}_2\text{O}_3 + \text{Al}_2\text{O}_3$  (Westinghouse)**
  - Synergy between the two additives:
    - pellet densification during sintering & enlarge the pellet grain size → > 35  $\mu\text{m}$
    - reduced Fission Gas Release (FGR)
    - improved Pellet Cladding Interaction (PCI) → increased pellet plasticity and higher resistance against post-failure degradation
- **GAIA Cr-doped  $\text{UO}_2$  (AREVA) 0.16%**
  - enhanced PCI resistance and lower risk of clad failure
  - reduction of FGR and induced rod internal pressure at the end of life
  - grain size → ~ 40-50  $\mu\text{m}$
- **Gd-doped  $\text{UO}_2$  (<10 %) = f(country, PWR/BWR)**

# 1. Introduction

DGR

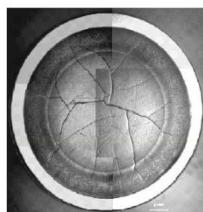

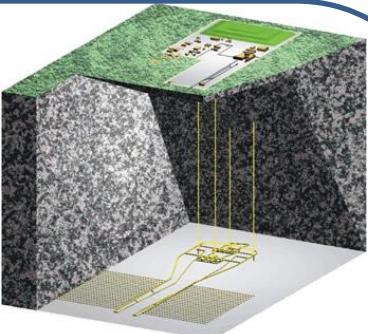

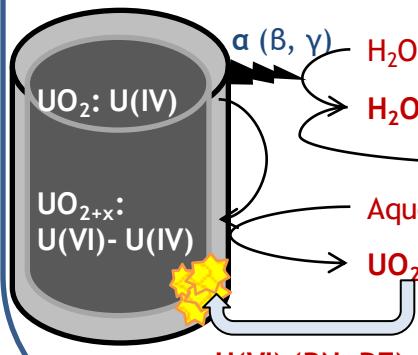

Degradation

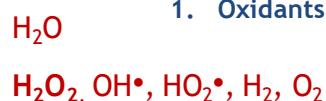

~ 1000 y

GW-radiation interaction

1. Oxidants (water radiolysis)

2.- SF oxidation

Aqueous ligands:  $\text{OH}^-$ ,  $\text{HCO}_3^-$ , ...

$\text{UO}_2^{2+} + \text{RN}$

3.- Disolution

4.- Precipitation (Sec. Phases)

## Irradiated fuel in DGR

Long term behaviour

### Environment conditions

pH

Eh: oxidizing/reducing

Temperature

Water:  $\text{CO}_3^{2-}/\text{HCO}_3^-$ , cations ( $\text{Ca}^{2+}$ ,  $\text{Si}^{4+}$ )

Gas:  $\text{H}_2$ ,  $\text{O}_2$ ,  $\text{CO}_2$ , ...

### Irradiated fuel attributes

Pre-Oxidation( $\text{UO}_{2+x}$ ) or hydration ( $\text{UO}_3 \cdot x\text{H}_2\text{O}$ )

SE, grain size, swelling

Cladding: corrosion/hydride

PCI

Composition: oxides, metals, RN

## Cement Groundwaters

- Why? → Ubiquitous in engineering barriers
- What? → Highly-alkaline and chemically reducing environment
- Radionuclides retention / apparently lower dissolution rate of SF (vs neutral): minimise radionuclide solubility and provide sites for radionuclide sorption

U(IV) increases its redox sensitivity at high pH (and relatively low Eh)\*

- LWR-UO<sub>2</sub> SNF  $50.4 \text{ GWd}\cdot(\text{tHM})^{-1}$  in YCW (H<sub>2</sub> overpressure, SHE=-0.74 V) →  $[\text{U}] = 1.5 \cdot 10^{-9} \text{ M}^{**}$
- YCW → SCK-CEN\*\*\*
- pH = 13.5 (initial state of cement degradation)

\* Ollila, K. (2008) POSIVA WR 2008-75

\*\* Loida, A. et al. (2012) MRS 1475, 119–124

## 2. Motivation

Sample fabrication “dry route” & characterization

$UO_2$	$UO_2 - Cr_2O_3$	$UO_2 - Cr_2O_3 - Al_2O_3$	$UO_2 - Gd_2O_3$
	0.02 wt% 0.06 wt%	0.05 - 0.02 wt%	4.50 wt%

Matrix corrosion of modern LWR fuels under DGR relevant conditions for improving the predictive capability of SF corrosion models and reduction of associated uncertainties.

- Element release & corrosion rates. Conditions: neutral-alkaline. Anoxic & reducing.
- Characterization of the microstructural evolution upon corrosion by advanced micro-analytical tools.
- Establishing a link between matrix corrosion behaviour of  $UO_2$ -based model systems and spent fuel.

### 3. Fabrication & characterization

### 3. Fabrication & characterization: Pellet characterization. Raman

#### Pellet

UO<sub>2</sub> ground  
 $\Phi = 19.6 \mu\text{m}$

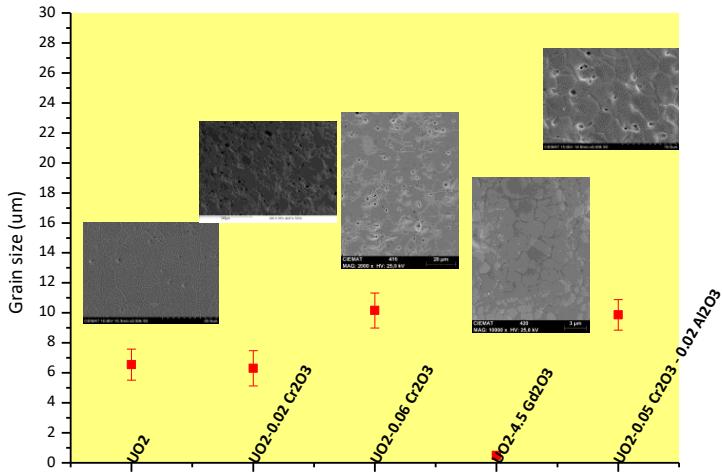

Increased [Cr] → extra characteristic band (wide and asymmetric) LO  $\sim 540 \text{ cm}^{-1}$  from 600 ppm.

Z. Talip, J. Am. Ceram. Soc., 2015, 98[7], 2278-2285

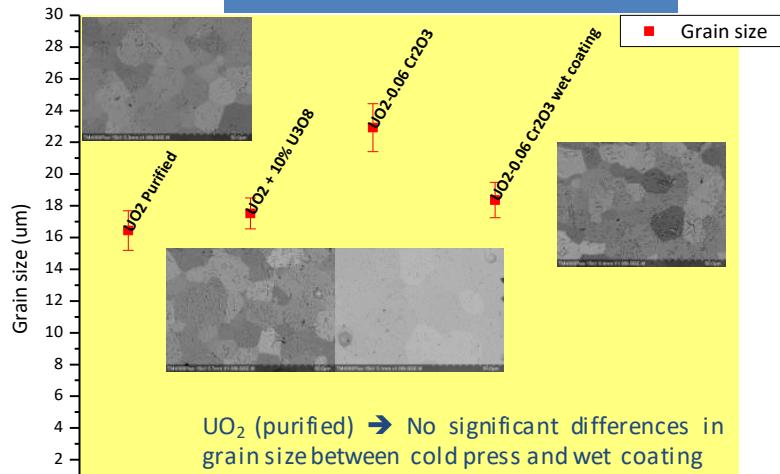

### 3. Fabrication & characterization: Pellet characterization.

$UO_2$  ground ( $\Phi = 19.6 \mu\text{m}$ )

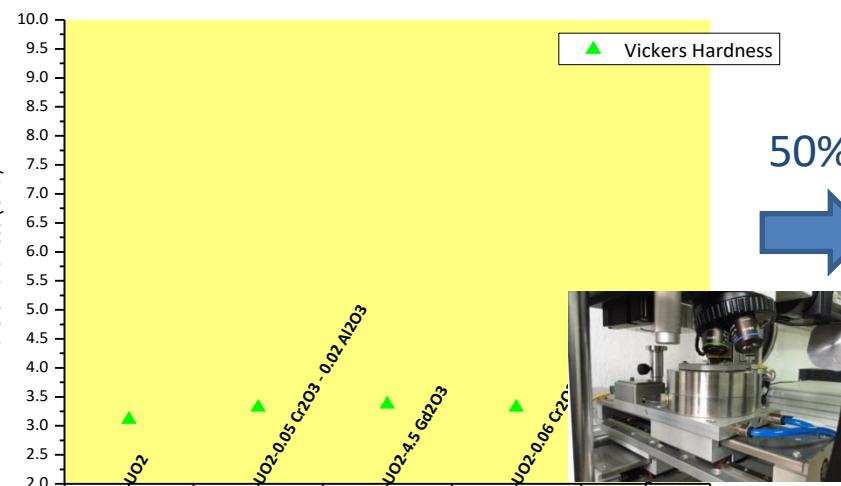

x 2

$UO_2$  purified ( $\Phi = 3.52 \mu\text{m}$ )

Grain size: linear intercept (LI) → SEM

Vickers Microhardness: Diagonal lengths of the Vickers indentation

50%

## 4. Dissolution tests with doped $UO_2$

### Batch Autoclaves (7- 8 bar 4.7% $H_2-N_2$ )

#### Materials

- $UO_2 + 0.06\% Cr_2O_3$
- $UO_2 + 0.05\% Cr_2O_3 - 0.02\% Al_2O_3$
- $UO_2 + 4.5\% Gd_2O_3$

#### Media - reducing (300 ml)

- PC  $\equiv$  Blank ( $0.02M NaClO_4$ ) pH  $7.2 \pm 0.1$
- BC  $\equiv$  Bicarbonate water ( $0.019M NaHCO_3 - 0.001M NaCl$ ) pH  $8.9 \pm 0.1$
- YCW  $\equiv$  Cementitious water pH  $13.2 \pm 0.1$

### Static anoxic test- Batch (Ar atmosphere)

#### Materials

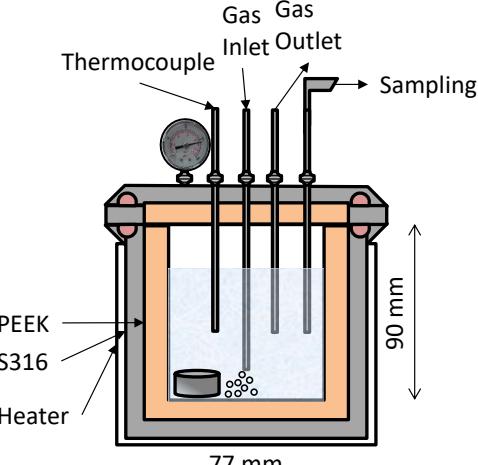

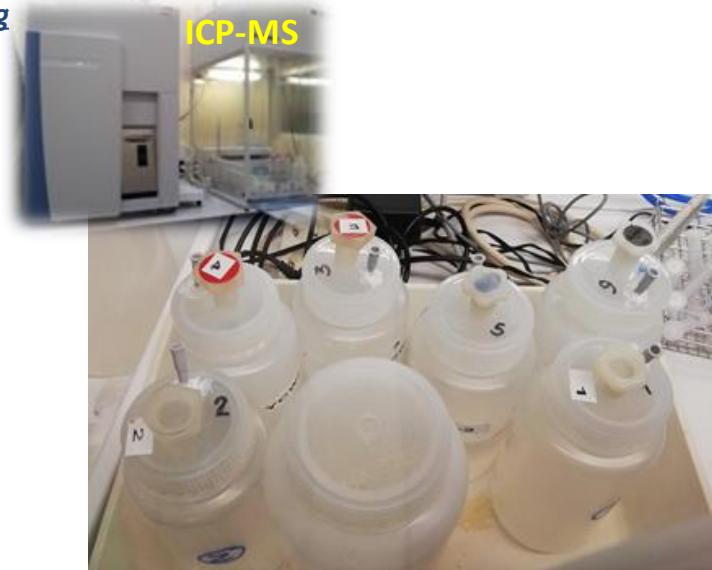

- $UO_2 + 0.06\% Cr_2O_3$
- $UO_2 + 0.05\% Cr_2O_3 - 0.02\% Al_2O_3$

#### Media - anoxic (300 ml)

- YCW  $\equiv$  Cementitious water pH  $13.2 \pm 0.1$

#### Experimental parameters monitoring

- $[O_2]$  (glovebox <2ppm)
- Temperature ext.
- pH, Eh
- Concentration in solution by ICP-MS

**4. Dissolution tests with doped  $UO_2$ :**  
**Batch Autoclaves (7- 8 bar 4.7%  $H_2-N_2$ ) –  $NaClO_4$ . Pre and post characterization**

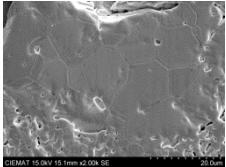

## PRE-LEACHING

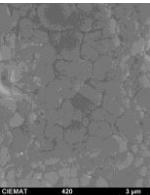

$\text{UO}_2$  0.06%  $\text{Cr}_2\text{O}_3$

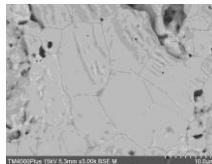

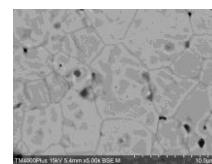

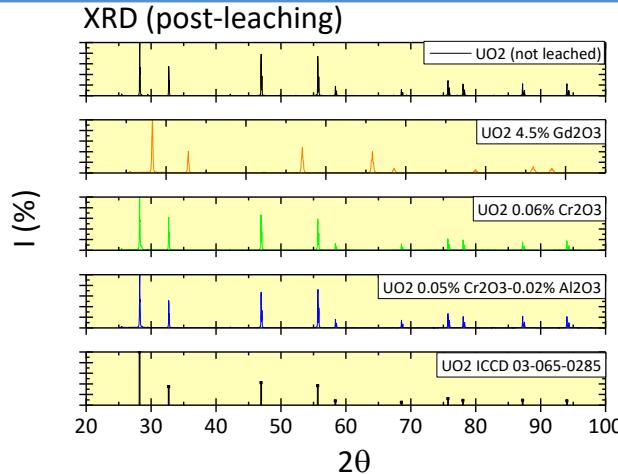

$\text{UO}_2$  0.05% $\text{Cr}_2\text{O}_3$  0.02% $\text{Al}_2\text{O}_3$

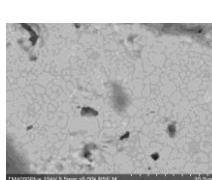

$\text{UO}_2$  4.5% $\text{Gd}_2\text{O}_3$

# POST-LEACHING

The figure shows Raman spectra for two samples:  $\text{UO}_2$ -0.06%  $\text{Cr}_2\text{O}_3$  pre (blue line) and  $\text{UO}_2$ -4.5%  $\text{Gd}_2\text{O}_3$  pre (red line). The x-axis represents the Raman shift in cm<sup>-1</sup>, ranging from 400 to 1200. The y-axis represents the normalized intensity in arbitrary units. Both samples exhibit characteristic Raman peaks for UO<sub>2</sub> at approximately 450, 600, and 1100 cm<sup>-1</sup>. The peak at ~600 cm<sup>-1</sup> is significantly more intense in the red line sample compared to the blue line sample. Vertical dashed lines are drawn at 450 and 600 cm<sup>-1</sup> to highlight these features.

## 4. Dissolution tests with doped $UO_2$ : Static anoxic test- Batch (Ar atmosphere)

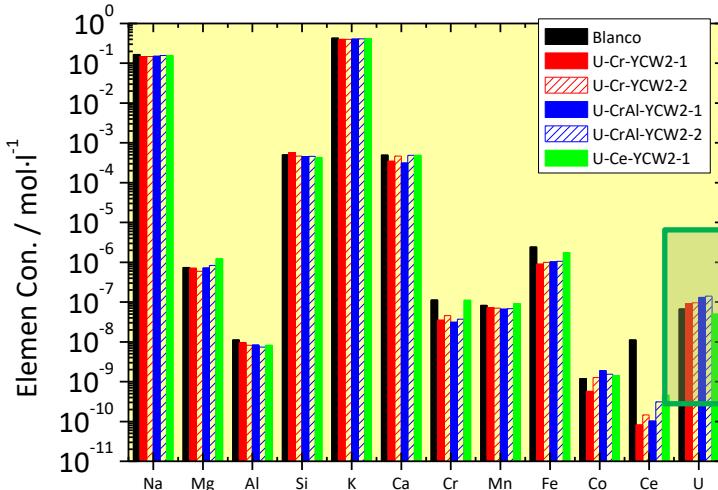

## 5. Conclusions

- Starting  $\text{UO}_2 \rightarrow$  ground and purified : Starting with purified powders (ADU) provides improvements in grain size and microhardness, due to relieve the residual stresses ("memory effect")
- Trivalent dopant are embedded in fluorite  $\text{UO}_2$  crystalline structure and no significant differences between cold press and wet coating

$\text{H}_2 = 0.37 \text{ atm}$  with doped  $\text{UO}_2$  samples in

- in  $\text{NaClO}_4$  0.02M similar U concentration ( $10^{-9} \text{ M}$ ) = Background
- in  $\text{HCO}_3^-$  19mM, 1-3 orders of magnitude higher in U conc.
- Anoxic Static leaching in YCW  $\rightarrow \approx 10^{-7} \text{ M}$  of U released = Background
- No secondary phases

- *Thanks to SCK-CEN (T. Mennecart) for his help in YCW preparation*
- *Thanks to all partners involved in High Level Waste Unit - CIEMAT*

Fabrication: Fernández, S.,

Purification (PUREX): Nuñez, A.

Raman spectroscopy: Bonales, L.J., Milena-Pérez, A.

XRD: Nebot, L.,

Operative work, glove box and ICP-MS: Durán, S., Anta, L., Serrano, L.

*This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 755443*
