

CONFIDENCE: Dealing with uncertainties in multi-criteria decision analysis tools

Wolfgang Raskob and Tim Müller
Karlsruhe Institute of Technology (KIT)

RICOMET workshop 13.06 and 15.06.2018, Antwerp, The Netherlands

 This project has received funding from the Euratom research and training programme 2014-2018 under grant agreement No 662287
 

Introduction

- The CONFIDENCE Project will perform research focussed on **uncertainties** in the area of **emergency management** and **long-term rehabilitation**. It concentrates on the **early** and **transition** phases of an emergency, but considers also longer-term decisions made during these phases.
- Duration: 1.1.2017 – 31.12.2019
- 31 partners from 17 countries
- Budget: 6.201.026 €, request to EC: 3.252.487 €
- Part of CONCERT

 This project has received funding from the Euratom research and training programme 2014-2018 under grant agreement No 662287

Which uncertainties

- 'Uncertainty' is interpreted differently by different people and disciplines
- It can include **stochastic uncertainties** (i.e. physical randomness), **epistemological uncertainties** (lack of scientific knowledge), **ambiguities** (ill-defined meaning), **value uncertainties** (when the required endpoint is ill-defined), **judgemental uncertainties** (e.g. setting of parameter values in codes), **computational uncertainties** (i.e. inaccurate calculations), **modelling errors** (i.e. however good the model is, it will not fit the real world perfectly)
- We should also address **social and ethical uncertainties**, in the analysis of risk and in decision making

This project has received funding from the Euratom research and training programme 2014-2018 under grant agreement No 662287.

Uncertainties in CONFIDENCE

- The following lists all work packages of CONFIDENCE
 - WP1: Pre- and release phases
 - WP2: Improve the common operational picture
 - WP3: Improve radioecological models
 - WP4: Transition to long term recovery
 - WP5: Stakeholder, social and ethical aspects
 - **WP6: Facilitate decision making**
 - WP7: Education and training
- Uncertainties in the early phase mainly due to weather and source term
- Uncertainties in the transition phase are more difficult to grasp; societal and ethical issues may be more important
- Uncertainties in the later phase might even be more dominated by other factors than uncertainties of radiological modelling and monitoring

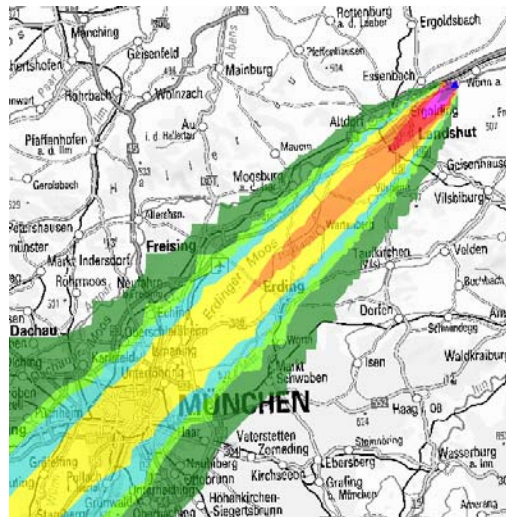

This project has received funding from the Euratom research and training programme 2014-2018 under grant agreement No 662287.

Typical result of dose model - deterministic

■ Dose for action:
“sheltering” is
10 mSv

▲ Nuclear power plant

Eff dose (external+inhalation over 7 days)
(mSv)

[1E-03 ; 3E-01]

[3E-01 ; 1E00]

[1E00 ; 3E00]

[3E00 ; 1E01]

[1E01 ; 3E01]

[3E01 ; 1E02]

[1E02 ; 3E02]

[3E02 ; 1E09]

Maximum:

3.44E-03

d. for sheltering:

10 mSv

Topographic map 1:1000 000

This project has received funding from the Euratom research and training programme 2014-2018 under grant agreement No 662287.

Main source of uncertainty & current research

- Input data (two key variables):
 - **Source term** → variations of several orders of magnitude
 - **Weather**
- Approach: Use **ensembles** to demonstrate uncertainty
 - Set of deterministic results based on slightly changed input and model parameters
 - Possible visualization: Areas indicating the probabilities for exceeding the dose threshold for certain countermeasure

This project has received funding from the Euratom research and training programme 2014-2018 under grant agreement No 662287.

Multi-Criteria decision making (MCDM)

- Decision support for emergency management involves resolving conflicting objectives, setting priorities and building consensus for the various perspectives of the many stakeholder groups
- MAVT (Multi-Attribute Value Theory) is a MCDM framework that provides methods to structure and analyse problems by means of attribute trees and to elicit the relative importance of the criteria in such a tree
- Several key phases of MCDM (resp. of MAVT) can be distinguished

 This project has received funding from the Euratom research and training programme 2014-2018 under grant agreement No 662287.

MCDA basics

- A set of alternatives A_1, \dots, A_n describing the possibilities for decision making for a given scenario
- The criteria C_1, \dots, C_m important for the decision making in that scenario have to be defined as value for each criterion-alternative pair
- The importance of the criteria is taken into account by weights w_1, \dots, w_m defined for each criterion

 This project has received funding from the Euratom research and training programme 2014-2018 under grant agreement No 662287.

MCDA uncertainties

- Criterion and weights can be defined as single values: deterministic approach
- How to deal with uncertainties
 - Applying a distribution
 - Providing boundary conditions (e.g. 5% and 95%)
- Proposed realisation
 - Providing direct results from ensemble calculations for attributes
 - Providing a distribution for the weights

This project has received funding from the Euratom research and training programme 2014-2018 under grant agreement No 662287.

Example

- Urban decontamination (from HARMONE handbook)
- Three options
 - Low waste
 - High waste
 - Do nothing
- Attributes
 - Max. individual dose
 - Costs
 - Number of workers
 - Acceptance
- For all examples: 2001 ensembles used with a statistical distribution of values
- In future, direct input from JRodos foreseen

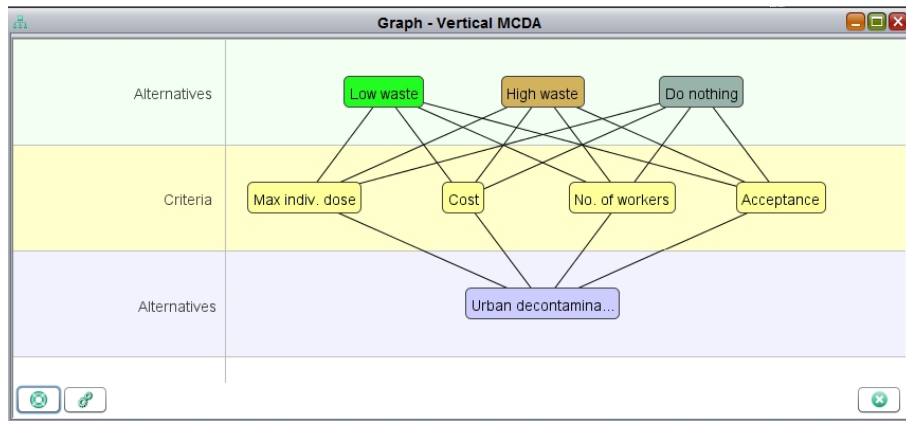

This project has received funding from the Euratom research and training programme 2014-2018 under grant agreement No 662287.

MCDA problem definition

Main window

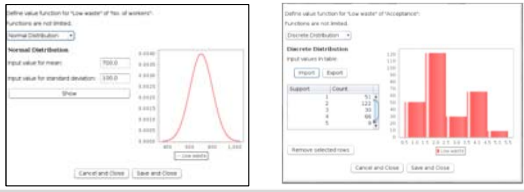

The way forward

- Within CONFIDENCE the ensemble approach will be implemented in JRodos (weather and source term) and all simulation models up to the late phase will use this information.
- Direct link with the MCDA will be established, for example:
 - Ensemble of 30 weather realisations with equal probabilities times 3 source terms with different probabilities = 90 realisations, each with a particular probability
 - Strategies with a given preference setting can be tested against these ensembles by repeated MCDA
 - The MCDA is applied to each of the realisations and the results are weighted with their probabilities
- In this way, simulated uncertainties or estimated uncertainties can be used as input for the MCDA

The figure displays two screenshots of the MCDA software interface, showing input and output for a 'Low waste' scenario.

Left Screenshot: Input
Define value function for 'Low waste' of this set of scenarios? Functions are not defined. Normal Distribution. Input value for mean: 750.0, Input value for standard deviation: 150.0. Show. Cancel and Close. Save and Close.

Right Screenshot: Output
Define value function for 'Low waste' of this set of scenarios? Functions are not defined. Normal Distribution. Output value for mean: 750.0, Output value for standard deviation: 150.0. Show. Cancel and Close. Save and Close.
